

Course Title	Data Mining				
Course Code	WSS551				
Course Type	Specialization (Elective)				
Level	Master (2nd Cycle)				
Year / Semester	2 or 3				
Teacher's Name	Harris Papadopoulos, PhD				
ECTS	10	Lectures / week	3	Laboratories / week	0
Course Purpose	<p>The computerization of modern society facilitated the generation and collection of an ever-increasing volume of raw data. The World Wide Web contains about a trillion web pages! The Large Hadron Collider computers at CERN record about 15 petabytes a year! The amount of data stored in the world's databases doubles every 20 months! These are just a few of the many facts that demonstrate the explosive growth in the quantity of data being recorded. These astonishing amounts of data contain a great deal of potentially important and valuable information waiting to be discovered. The role of Data Mining (DM) is to make this discovery possible. In particular, DM is about automatically extracting implicit, previously unknown and potentially useful information from substantial quantities of data. The constant increase in our ability to record data together with the significant benefits resulting from the application of DM in a variety of diverse areas have made it one of the most promising and flourishing fields of Computer Science.</p> <p>This course will introduce students to the major principles, terminology, problem types and research topics of DM. The main technical basis for DM comes from Machine Learning (ML), which is used for acquiring structural descriptions from data. These descriptions can either be used to predict the outcome of a new situation, or for the explanation and understanding of the behaviour of the source of the data. The course will examine the main ideas behind some of the leading ML techniques being used in practical DM and the issues that should be considered in their application. Additionally, it will consist of hands-on experimentation on real life problems and data to promote the development of critical thinking on the proper application of ML techniques.</p> <p>The course aims to provide you with the knowledge of the essential tools and techniques to:</p> <ul style="list-style-type: none"> • identify situations in which the application of Data Mining is required or beneficial and • conduct a Data Mining investigation of a practical Machine Learning problem and critically analyse and evaluate the results. 				
Learning	By the end of the course the students are expected to:				

Outcomes	<ul style="list-style-type: none"> • Define and explain the major principles, terminology and problem types of Data Mining • Describe and discuss the main Machine Learning techniques used in practical Data Mining and their theoretical basis and evaluate their strengths and weaknesses • Explain and propose ways of dealing with the issues involved in the application of Machine Learning techniques to practical problems • Apply Machine Learning techniques to a practical problem both in an exploratory or a targeted manner • Analyse and evaluate the performance of Machine Learning techniques on a supervised Data Mining task • Define and apply the main data transformation approaches used in practical Data Mining • Define and explain the main concepts and terminology of Web Mining • Define, explain and demonstrate the main concepts, approaches and issues for designing a recommendation system • Describe and explain the two main versions of the Conformal Prediction framework for quantifying uncertainty both in classification and regression and evaluate their outputs 		
Prerequisites	None	Corequisites	None
Course Content	<p>This course consists of the following ten chapters:</p> <ul style="list-style-type: none"> • Chapter 1 is the introductory chapter for the whole course • Chapter 2 introduces the main components and terminology of a Data Mining task • Chapter 3 analyses the main ideas behind some of the leading techniques that are used in practical Data Mining • Chapter 4 deals with the evaluation and comparison of Machine Learning techniques • Chapter 5 examines some of the most prominent advanced Machine Learning techniques used in practice today • Chapter 6 introduces the unsupervised learning setting and various approaches for this setting leading to different kinds of representations • Chapter 7 studies data engineering approaches for transforming the input and output to a suitable or even more effective form • Chapter 8 examines Web Mining and its three types: Web Content Mining, Web Structure Mining and Web Usage Mining • Chapter 9 deals with recommendation systems and analyzes the core concepts behind the two main types of recommendation systems: content-based and collaborative filtering • Chapter 10 introduces a recently developed framework for quantifying the uncertainty of Machine Learning predictions, called Conformal Prediction 		
Teaching	The methodology used to conduct the course is structured around lectures and laboratory exercises, so that students gain theoretical knowledge as		

Methodology	<p>well as practical skills. The taught part of the course is delivered to the students with the help of computer presentations. Lecture notes and presentations are available through the web (e-learning platform) for students to use in combination with the textbooks. Furthermore, theoretical principles are explained by means of specific examples and for solving specific problems using practical examples.</p> <p>Lectures are supplemented with supervised and unsupervised computer laboratories. Laboratories will include demonstrations of taught concepts and experimentation with related technologies. Additionally, during laboratory sessions, students apply their gained knowledge and identify the principles taught in the lecture sessions by means of working on different tasks and problems. Students are also allocated exercises for homework, assignments and/or group project to improve both their individual skills and team work.</p>

Assessment	<p>The Students are assessed via continuous assessment throughout the duration of the Semester, which forms the Coursework grade and the final written exam. The coursework and the final exam grades are weighted 60% and 40%, respectively, and compose the final grade of the course.</p> <p>Various approaches are used for the continuous assessment of the students, such as class participation and in class exercises, assignments, projects and tests. The assessment weight, date and time of each type of continuous assessment is being set at the beginning of the semester via the course outline. An indicative weighted continuous assessment of the course is shown below:</p> <ul style="list-style-type: none"> • Participation Activities (10% of total marks for module) • Two marked assignments (20% of total marks for module) • One project (30% of total marks for module) • One closed-book, 3-hour exam (40% of total marks for module) <p>Students are prepared for final exam, by revision on the matter taught, problem solving and concept testing and are also trained to be able to deal with time constraints and revision timetable.</p> <p>The criteria considered for the assessment of each type of the continuous assessment and the final exam of the course are: (i) the comprehension of the fundamental concepts and theory of each topic, (ii) the application of the theory in solving related problems and (iii) the ability to apply the above knowledge in complex real-life problems.</p> <p>The final assessment of the students is formative and summative and is assured to comply with the subject's expected learning outcomes and the quality of the course.</p>
